

Building Reports, Dashboards, and Custom Pages (UI Builder) for the Gym Membership Enrollment and Front Desk Management Application in Zoho Creator

Jashwanth Sundarajan (241401032) – B.Tech Computer Science and Business System

AIM

To design and build custom report views, a calendar-based scheduling report, and an interactive dashboard page using Zoho Creator's Reports module and UI Builder for the Gym Membership Enrollment and Front Desk Management application, so that the front desk can see members grouped by plan length, check which memberships are about to start, and monitor enrollment types and approval status at a glance, layered on top of the base Member_Name form and Member_Name Report.

PROCEDURE

The front desk's day-to-day questions were first reviewed against the data already captured by the Member_Name form, which records the member's name, age, membership type (New Member, Renewal, or Corporate Enrollment), email address, contact number, and residential address. Three needs stood out: a plan-wise view of who is enrolled on a monthly, quarterly, or annual basis, a calendar showing when each membership begins, and a single summary page combining charts, headline counts, and the form itself.

From the Reports panel, a Kanban report named *gym report* was created on top of the Member_Name form. Its columns were set up by membership duration — Monthly, Quarterly, Annual, and Deleted & Others — with each card showing the member's name and age for quick scanning. A second report, *Upcoming_Start_Dates*, was built as a calendar report so that members appear against their membership start date, with Month, Week, and Day views available for switching between a broad overview and a detailed daily schedule.

Next, a page was added to the application from the Pages panel and arranged in the UI Builder. Two donut charts were placed at the top, each segmenting members by Membership_Type into New Member, Renewal, and Corporate Enrollment. Beside them, two KPI widgets were added to show the number of approvals still pending and the number of requests declined, giving the front desk two headline figures without opening a report.

Below the charts, the Member_Name form was embedded on the left so that a new member can be enrolled directly from the dashboard, with its Member Info section (name, age, and membership type) and Personal Details section (email, contact number, and address). The Member_Name Report was embedded on the right, listing every enrolled member with columns such as Member_Name, Membership_Type, Email_Address, and Contact_Number, so that a newly submitted record is visible immediately beside the form.

The new pages and reports were then added to the application's left-hand navigation, alongside the existing Member_Name entries, and previewed to confirm that the Kanban cards, calendar entries, charts, KPI values, and embedded form and report all displayed correctly against the submitted member records.

Throughout the build, the Kanban and calendar reports were treated as complementary views of the same data rather than separate lists: the Kanban report answers who is on which plan, while the calendar answers when each membership starts. Keeping both bound to the Member_Name form meant that a member added or edited once was reflected everywhere without any duplicate entry.

The dashboard page was deliberately kept to a single screen so that a front-desk staff member could read the charts and KPIs, enrol a walk-in member through the embedded form, and confirm the new record in the embedded report without switching pages, which is the main advantage of building a custom page in the UI Builder instead of relying on standalone forms and reports.

OUTPUT

The following screenshots capture the completed reporting layer: the plan-wise Kanban report, the combined dashboard page with charts, KPIs, form, and report, and the calendar report of upcoming membership start dates.

The above screenshot shows the gym report Kanban view, grouping members into Monthly, Quarterly, Annual, and Deleted & Others columns, with each card displaying the member's name and age.

In this view the Monthly column holds one member (Jashwanth s, 18), the Quarterly column holds five members (karan k, Vijay A, raja rk, advay anand, and maran k), and the Annual and Deleted & Others columns currently show the empty-state message, confirming that the grouping picks up records correctly and leaves unused plan types visibly empty.

The above screenshot shows the dashboard page, with the two Membership_Type donut charts, the Approvals pending and Requests declined KPIs, the embedded Member_Name form, and the Member_Name Report.

The two donuts split members by New Member, Renewal, and Corporate Enrollment, the KPI cards show 25 approvals pending and 10 requests declined, and the report on the right lists each member with membership type, email, and contact number, so the chart, the headline counts, and the underlying records can all be read from one screen.

The above screenshot shows the Upcoming_Start_Dates calendar report for August 2026, with Month, Week, and Day views and members placed against their membership start dates.

The calendar shows August 2026 with membership start dates marked on the 18th, 20th, 21st, and 26th of the month and on 1 September, and a card for karan k (45) appearing against the 17th. The Today button and the previous and next arrows allow the front desk to jump straight to the current date or move between months, while the Week and Day tabs give a closer look at a single date.

RESULT

Custom reports and an interactive dashboard page were successfully built in Zoho Creator for the Gym Membership Enrollment and Front Desk Management application using the platform's Reports module and UI Builder. A Kanban report grouped members by plan length, a calendar report placed each membership against its start date, and a dashboard page combined membership-type donut charts, pending and declined request counts, and the embedded enrollment form and member report in one place. The exercise thus demonstrated how the raw member data captured through a single form can be layered into reports and dashboards that support a real front-desk enrollment workflow.
