EXPERIMENT 10

Applying Performance Optimization Techniques (Indexing, Subforms, and Query Tuning) to a Zoho Creator Application

JASHWANTH SUNDARAJAN | 241401032 | B.TECH CSBS

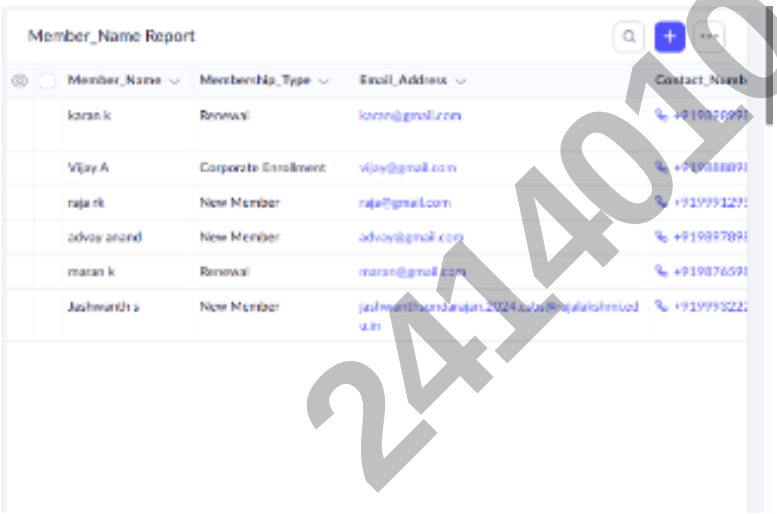

Aim:

To improve the performance and data management of the Gym Membership Management application in Zoho Creator using indexing concepts, subforms, and query tuning techniques.

Procedure:

Step 1: Indexing

- Identified frequently searched fields, such as Membership Type.
- Studied how indexing can improve record retrieval speed.
- Used the report search feature to search member records based on selected field values.

241401032

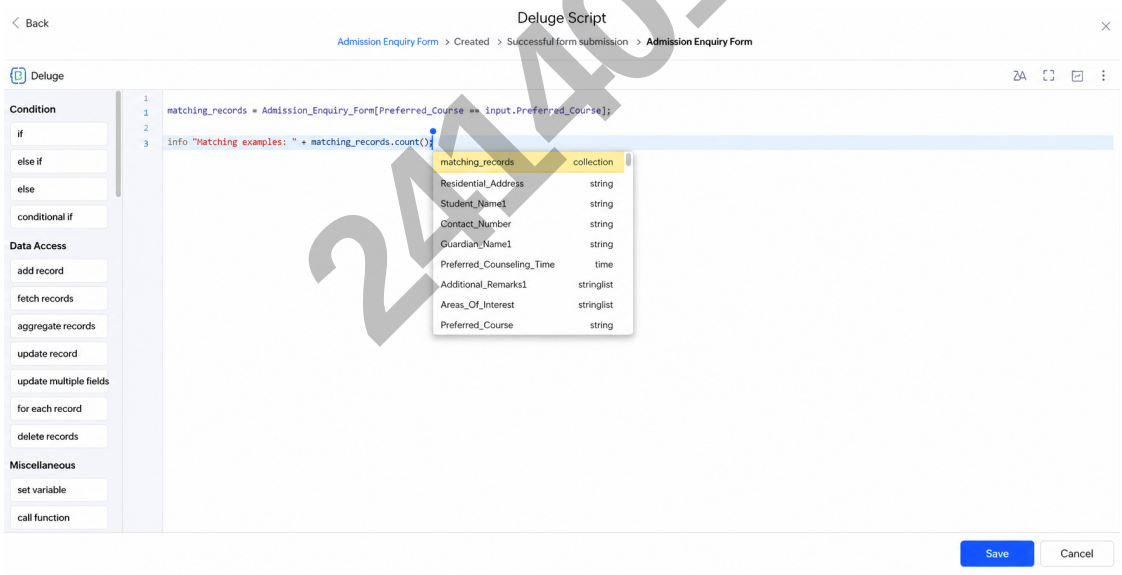

Step 2: Creating a Subform

- Opened the Gym_Member_Form in edit mode.
- Added a subform named Additional_Activity_Preferences.
- Added the fields Activity_Name and Preference_Level.
- Configured the preference options as First Choice, Second Choice, and Third Choice.
- Saved the form and submitted a test member registration with multiple activity preferences.
- Verified that the submitted activity preferences appeared in the saved record.

Step 3: Query Tuning

- Studied criteria-based record retrieval using Deluge scripting.
- Used the Membership Type field as a filter to retrieve matching member records.
- Examined how retrieving only the required records can reduce unnecessary data processing.

24401032

Result:

The Gym Membership Management application was enhanced with a subform for storing multiple activity preferences. Record searching and criteria-based query techniques were studied to understand performance optimization in Zoho Creator. Indexing concepts were also studied to understand their role in improving data retrieval efficiency.
